

MOLECULAR CANCER DIAGNOSTIC FOR SOLID TUMORS

OncoGxOne™ analyzes a patient's tumor for genetic mutations found in cancers.

- Profiles clinically relevant mutations in 56 genes to guide the selection of targeted therapies
- Assays 8 genes with pharmacogenomics (PGx) information to help predict response to chemotherapies
- Detects all mutation types, including SNV, Indel, gene fusion, and CNV
- Average depth of coverage exceeds 250x resulting in mutation detection with high specificity and sensitivity
